Title: Plastics piping systems for non-pressure underground drainage and sewerage -

Polypropylene solid wall multilayer piping systems (PP-ML) - Requirements for pipes,

fittings and the system

Scope:

This document specifies requirements for solid wall piping systems with multilayer wall construction (PP-ML) made of reinforced polypropylene compounds or polypropylene blends for gravity-operated underground sewers and sewers.

Furthermore, terms, nominal widths, dimensions, requirements, tests and self-monitoring for these piping systems are specified.

This document is applicable to piping systems with or without integral sockets and gives recommendations for the color scheme of the piping system. In addition, it contains requirements for fittings that are manufactured using either the injection molding process (SF) or the hand molding process (HF).

The document applies to the application of sewers and pipes for gravity drainage systems that are used outside the building structure (application code "U") as well as inside the building structure (application code "D"), where wastewater temperatures up to 45 °C are permitted.

Title: Emission Inventory for air pollutants and greenhouse gases

Scope: This ÖNORM describes the structure according to which an emission inventory for air

pollutants and greenhouse gases is to be compiled. This set of rules is intended to provide a $% \left\{ 1\right\} =\left\{ 1$

basis for interpreting the results of the emission inventories compiled by the federal

provinces according to the same criteria.

The compilation of an emission inventory is understood to mean the acquisition, linking, processing and modelling of data so that these can be fed into numerical, textual, graphic or

cartographic evaluations by means of automated data processing.

Emission inventories serve as an essential basis for the preparation of status surveys according to § 8 IG - L (Immission Control Act - Air) as well as programmes according to § 9a IG - L. They also form the basis for environmental protection programmes. In addition, they form the basis for environmental programmes (establishment of air remediation areas, preparation of clean air programmes and the implementation of evaluations as a result of measures taken), dispersion modelling of immission loads, purposes of spatial planning and regional planning in the environmental field, the preparation of small and large-scale air pollutant transport and emission models, emission reduction concepts and emission estimates for official operating plant licensing procedures and serve as a data pool for climate and energy model regions and climate protection programmes (greenhouse gas reduction programmes) as well as for energy monitoring reports and future strategies of the federal states.
